To: Our Valued Supporters

Accelerated Hydrogen Peroxide (AHP) disinfectant and cleaning technology has been firmly established as a safer and environmentally sustainable fast-acting alternative anti-microbial chemistry in many industries. AHP has enjoyed tremendous support from the scientific and academic communities and in particular the support of Infection Control Professionals.

As you may be aware, our business model at Virox Technologies Inc. contemplates and establishes strategic global partnerships. We have formed very successful alliances with JohnsonDiversey in the Industrial and Institutional markets as well as with other partners such as The Deb Group for Hand Care applications of AHP, DeLaval in the Dairy industry, Bayer in Veterinary and SciCan in Dental Markets.

It is extremely important that AHP be made available globally in the world's war against microbes and our partners are in a position to accomplish that endeavor. Virox Technologies has recently launched the AHP technology into the United States through JohnsonDiversey, DeLaval and SciCan with excellent early success and its growth in other countries around the world continues at a rapid rate. In addition, the world's first hand care product based on AHP was recently launched by DEB in Europe and will soon come to Canada as it is in the final stages of the registration process.

Expanding our global reach with a view to establishing AHP as a new standard in sterilization, it is with great pleasure that we announce the formation of a new, global strategic alliance partnership with the **STERIS Corporation**. Similar to Virox Technologies, STERIS is an acknowledged leader in the global fight against infection and contamination. STERIS serves researchers and professionals in the pharmaceutical, medical device manufacturing, defense and healthcare industries. STERIS is capable of addressing infection control needs with fully integrated programs that offer a portfolio of products, services and equipment. STERIS has the scope and reach to take AHP medical device cleaners and sterilants to the global marketplace.

The partnership between STERIS and Virox Technologies Inc. will see the introduction of a ready to use flexible endoscope compatible high level disinfectants as well as instrument cleaners based on AHP positioned as a new generation of disinfectants as compared to existing aldehydes and other high level disinfectant chemicals as well as enzymatic cleaners. The first High Level Disinfectant and Chemosterilant product for heat sensitive medical devices (flexible and rigid endoscopes) among other applications may be used as a cold soak or for use in AER's (Automatic Endoscope Reprocessors).

In Canada, Virox will continue to market branded (*ACCEL*) high-level disinfectants and chemosterilants directly through its own distribution network as well as the right to market specialty products and higher degree of care environmental surface disinfectant cleaners.

At Virox, we have gained a reputation for supporting public health and infection control personnel with information, particularly as it relates to the disinfection of devices and surfaces. This new partnership will greatly enhance the awareness, acceptance and growth of AHP both in Canada and worldwide and is a testimony to the desire of those charged with infection control to promote the use of safer yet efficacious disinfection technology.

Thank you for your continued support.

Sincerely Yours,

Randy Pilon
President and CEO
